# DIRECTIONS FOR PREPARING MICROGRAPHS FOR REPRODUCTION IN THE JOURNAL OF CELL BIOLOGY

Contributors should provide three sets of micrograph prints, *i.e.*, *three copies* of each print. Glossy prints are preferred.

*One set of prints*, intended for the engraver's use, should be *unmounted* and *unlabeled*. Labeling and mounting of this set will be done by the editorial office staff. The figure number should be written very lightly on the back of each print. To avoid damage in mail handling, this set of prints should be protected with cover tissues and board stiffener.

The other *two sets of prints*, also bearing figure numbers, should be labeled by the author. It is preferable to label the photos directly, particularly where highly pinpointed structure is to be signaled. An overlay is acceptable when all labels refer to broad regions and provided the overlay is attached firmly to the print. These two sets of prints need not be mounted. Authors should indicate, however, by means of layout "maps" or description, which figures must appear together on the same page. Unless authors advise otherwise, figures will be placed as near as possible to their textual mention. Authors should cite these major mentions. Figures can appear singly or in blocks. All illustrations, whether photos, charts, or drawings will be numbered in sequence as "figures." Tables will be numbered with Roman numerals.

In general, the field of a figure should be limited to the regions and structures discussed in the report; expanses of ground cytoplasm devoid of relevant structure should be avoided. Miniature or odd-shaped prints should not be used. If several figures are meant to appear together, they should be of uniform size and shape, suitable for a multi-photo layout. If a micrograph must be oriented specifically, the notation "top" should be marked on the back of the print.

Photographs will be reproduced without reduction, generally. In difficult cases, it may be necessary to crop, rotate, or reduce a print. The minimum size of engravings is $2\frac{5}{8}''$ (width of one column) by $2''$ (depth or height). The maximum size of a single figure or an array is $5\frac{1}{2}''$ by $8\frac{5}{16}''$, but it is preferable that the larger dimension not exceed $8''$. A few standard sizes should be kept in mind: $2\frac{5}{8}''$ wide by any depth up to $8''$; $5\frac{1}{2}''$ wide by any depth up to $8''$; $4\frac{1}{2}''$ to $5''$ wide by any depth from $2\frac{3}{4}''$ to $5\frac{1}{2}''$.
